Received 11 June 2010; accepted 23 June 2010

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.035; wR factor = 0.123; data-to-parameter ratio = 14.7.

In the title compound, $\text{C}_{18}\text{H}_{13}\text{ClFN}_3\text{O}_2$, the pyrrolidine ring adopts an envelope conformation and the planar part is rotated by $4.3(6)^\circ$ from the plane of the benzene ring and is almost perpendicular both to the diazoacetyl unit [dihedral angle = $78.93(7)^\circ$] and the phenyl ring [dihedral angle = $86.07(7)^\circ$]. In the crystal, molecules are linked into a three-dimensional framework by $\text{C}-\text{H}\cdots\text{O}$ interactions. The molecular conformation is stabilized by an intramolecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen bond.

1-(3-Chloro-4-fluorophenyl)-5-(2-diazoacetyl)-4-phenylpyrrolidin-2-one

J. K. Ray, P. Haldar, M. Canle L., M. I. Fernández P. and J. A. Santaballa

Comment

A view of the molecule with numbering scheme is shown in Figure 1. In the title compound (I), bond distances and angles are within normal ranges (Allen, 2002). The atoms of the chain containing the diazo group are planar [max deviation 0.339 (9) Å for N1]. The pyrrolidin ring adopts an envelope conformation with puckering parameters $q_2 = 0.2816 (12)$ Å and $\varphi_2 = 115.6 (2)$ ° (Cremer & Pople, 1975). The 3-chloro-4-fluoro-benzene ring and the best plane of pyrrolidin ring defined by C10\N1\C9\C8 atoms are almost coplanar [4.20 (7)°]. The phenyl ring and the acetyl group O2/C10/C17/C18 fragment (r.m.s. deviation 0.023 Å) are almost perpendicular to plane defined by the N1/C8/C9/C10/C11/C12/C13/C14/C15/C16 atoms (r.m.s. deviation 0.038 Å) [87.07 (5); 88.46 (3)° respectively]. In the crystal molecules are linked by C—H···O interactions [C···O range 3.2320 (16)-3.3445 (19) Å; C—H···O range 136-157°] and these link the molecules into a three-dimensional framework. The molecular conformation is stabilized by one intramolecular C—H···O hydrogen bond (Table 1). As shown in Figure 2, carbonyl oxygen O2 interacts with three H atoms (C10—H10···O2, C16—H18···O2, and C18—H18···O2), which regarding crystal packing could be classified as supportive (Desiraju, 2005).

Experimental

The title compound was synthesized from the corresponding γ -lactam carboxylic acid which, in turn, was prepared following the general method (Ray *et al.* 1994, 1998) developed in our laboratory, through the reaction of its acid chloride with diazomethane. Single crystal was grown by dissolving the compound in mixture (n-hexane-ethylacetate) solvent and then by slow evaporation technique at room temperature. It is a yellow colour solid; m.p. 407–409 K (n-hexane-ethylacetate).

Refinement

Hydrogen atoms were found in subsequent difference Fourier maps and included in observed positions and refined as free isotropic atoms.

Figures

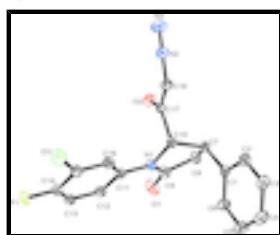

Fig. 1. View of the title compound showing the atomic numbering and 50% probability displacement ellipsoids. H atoms have been omitted for clarity.

supplementary materials

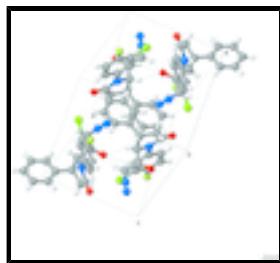

Fig. 2. Part of the crystal structure showing carbonyl oxygen O2 interacts with three H atoms.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.035$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.123$	All H-atom parameters refined
$S = 0.90$	$w = 1/[\sigma^2(F_o^2) + (0.1P)^2 + 0.4639P]$ where $P = (F_o^2 + 2F_c^2)/3$
4084 reflections	$(\Delta/\sigma)_{\text{max}} = 0.001$
278 parameters	$\Delta\rho_{\text{max}} = 0.42 \text{ e \AA}^{-3}$

0 restraints

 $\Delta\rho_{\min} = -0.33 \text{ e \AA}^{-3}$ *Special details*

Experimental. Data was collected using a X8 *APEX II* BRUKER-Nonius diffractometer equipped with an KYROFLEX low-temperature apparatus operating at 100 K. A suitable crystal was chosen and mounted on Mitegen MicroMount (radiation-hard polymer).

Data were measured using omega scans of 0.5° per frame for 10 s, such that a total of 1280 frames were collected in a optimized strategy and with a final resolution of 0.75 Å. Data integration and reduction was performed using the Apex2 (Bruker Nonius, 2005) suite software.

Absorption corrections were applied using *SADABS* (2004) of the suite software.

The structures are solved by the direct method using the *SHELX97* program and refined by least squares method on F2 *SHELXL97*, incorporated in the Apex2 suite software.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F^2 , conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

All non-hydrogen atoms were refined anisotropically. Hydrogen were found in subsequent difference Fourier maps and included in observed positions and refined as free isotropic atoms.
